

# parse.php

**function** — parse.php accept input in iprcode22 and transfer it on XML representation of code than print in on stdout

**implementation** — My script takes first string in the line and tries to find appropriate case for it in switch if it does not find the case it exit with error code 22. If it finds the case it checks the syntax of its parameters. If syntax is okay it write out XML representation if not it exits with exit code 23.

**not finished** — function check type is not finished yet.
